

This :

1. This is refer to current reference of the object (current context of the object)
2. They can display the details of the current object details if we are start printing them
3. this is actually not working in the function
4. this is basically working in the object

Eg.

```
const user={
  userName : "Manu",          // properties of the object
  userAge : 23,
  printingFunction:function() // behaviour of the object
  {
    console.log(`${this.userName} age is : ${this.userAge} `);
  }
}

user.printingFunction(); // printing the details of the first user
user.userName="Ram";
user.userAge=89;
user.printingFunction(); // printing the details of the update user
```
